

Recommended Wire Connections for Fujitsu Equipment

Proper wiring between Fujitsu units is crucial for trouble-free system operation. There should be uninterrupted wire run between units. If there has to be a splice connection made, you should use Two Way Compression Connectors.

Crimped Butt connectors like Nylon, Vinyl, Heat Shrink, Cool-Seal and other variations are strongly recommended by Fujitsu. Parallel connection assures better conductivity on electrical connection.

The Ultimate Electrical Connection

This is a properly done wire connection that should hold very tightly forever. To double check this, grab the connection with one hand and the wire with the other. Pull away from each other. You can now tape or shrink wrap this connection to further protect it.

Twist on wire connectors have only spot connection which decreases free electron flow and are not recommended especially on communication wiring.
